phenylalanine-tRNA ligase (BC 6.1.1.20) alpha chain [validated] - Thermus aq
phenylalanine-tRNA ligase (BC 6.1.1.20) alpha chain
N.Alternate names: phenylalanyl-tRNA synthetase alpha chain
C.Species: Thermus aquaticus
C.Species: Thermus aquaticus
C.Species: 22-Nov-1993 #sequence revision 23-Feb-1996 #text_change 03-Jun-2002
C.Accession: S22366; S25717; $61093; T52502; S21468

Zaa-, from a polypeptide, preferentially when Yaa is Pro, provided Zaa is neither Pro nor hydroxyproline.
SUBUNIT: Homodimer or heterodimer with Seprase (FAP).
SUBCELLULAR LOCATION: Type II membrane protein. Also exists in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            TISSUE SPECIFICITY: Expressed in the poorly differentiated crypt cells of the small intestine as well as in the mature villous cells. Expressed at very low levels in the colon.

FIM: The soluble form (SDPP) derives from the membrane form (MDPP) by proteolytic processing.

SIMILARITY: Belongs to the peptidase S9B family. DPPIV subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        X-RAY CRYSTALLOGRAPHY (2.5 ANGSTROMS) OF 39-766, HOMODIMERIZATION, AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            N-GLYCOSYLATION SITES.

Structural basis of proline-specific exopeptidase activity as observed in human dipeptidy peptidase-IV.";
Structure 11:947-959(2003)
-!- FUNCTION: Removes N-terminal dipeptides sequentially from polypeptides having unsubstituted N-termini provided that the penultimate residue is proline. Plays a role in T cell activation.
-!- CATALYTIC ACTIVITY: Release of an N-terminal dipeptide, Xaa-Yaa-|-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             X-RAY CRYSTALLOGRAPHY (2.5 ANGSTROMS) OF 39-766, HOMODIMERIZATION, AND

--- prm: The soluble form (SDPP) derives from the membrane form (MDPP) by proteolytic processing.
---- SIMILARITY: Belongs to the peptidase S9B family. DPPIV subfamily.
                                                                                                                                                                                                                                                                                               MEDLINE=91273813; PubMed=1675855;

                                                                                                                                                                                                                                          -!- TISSUE SPECIFICITY: Expressed in bile ducts and other epithelial brush borders (small intestine, Kidney, colon, pancreatic duct); acinar structures in salivary glands; endothelial structures and T cell areas in thymus; spleen and lymph node.
                             Hong W., Doyle D.;
"Molecular dissection of the NH2-terminal signal/anchor sequence of
"at dispetidy! peptidase IV.";
J. Call Biol. 111:323-328 (1990).
-!- FUNCTION: Removes N-terminal dispetides sequentially from
polypeptides having unsubstituted N-termini provided that the
ponlymate residue is proline.
-!- CATALYTIC ACTIVITY. Release of an N-terminal dispetide, Xaa-Yaa-|-
Zaa, from a polypeptide, preferentially when Yaa is Pro, provided
Zaa is neither Pro nor hydroxyproline.
                                                                                                                                                                                                                                                                                                                                   by proteolytic processing.
SIMILARITY: Belongs to the peptidase S9B family. DPPIV subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (By similarity).

-!- PATHWAY: Ubiquinone biosynthesis.
-!- SIMILARITY: Belongs to the methyltransferase superfamily.
Ubig/COQ3 family.
                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The C.briggsae Sequencing Consortium;

Submitted (SEP-2003) to the EMBL/GenBank/DDBJ databases.

-- CAUTION: The sequence shown here is derived from an english sequence shown here is derived from an preliminary data.

EMBL/GenBank/DDBJ whole genome shotgun (WGS) entry which is preliminary data.

EMBL/GenBank/DDBJ whole genome shotgun (WGS) entry which is good GO:00018024; CAES6836.1; -; Genomic_DNA.

Dipeptidyl peptidase 4 (EC 3.4.14.5) (Dipeptidyl peptidase IV) (Treal activation antigen CD26) (Thymocyte-activating molecule)
(THAM) (Contains: Dipeptidyl peptidase 4 membrane form (Dipeptidyl peptidase IV membrane form); Dipeptidyl peptidase IV soluble form)
(Dipeptidyl peptidase IV soluble form))

Name-DDP4; Synonymas-Cd26;
Mus musculus (Mouse)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              "CDNA cloning for mouse thymocyte-activating molecule. A multifunctional ecto-dippeptidyl peptidase IV (CD26) included in subgroup of serine proteases "; J. Biol. Chem. 267:2200-2208(1992).
                                                                                                                                                                                    Genoscope; Whitehead Institute Centre for Genome Research;
Submitted (FBS-2004) to the EMBL/GenBank/DDBJ databases.

J. Immunol. 147:447-454 (1991).

-!- FUNCTION: Removes N-terminal dipeptides sequentially from polypeptides having unsubstituted N-termini provided that the penultimate residue is prolline.

-!- CATALYTIC ACTIVITY: Release of an N-terminal dipeptide, Xaa-Yaa-|- Zaa-, from a polypeptide, preferentially when Yaa is Pro, provided Zaa is neither Pro nor hydroxyproline.

ö

removed

soluble form. PTM: The soluble form (SDPP) derives from the membrane form (MDPP)

SUBUNIT: Homodimer. SUBCELLULAR LOCATION: Type II membrane protein. Also exists in a

by proteolytic processing. SIMILARITY: Belongs to the peptidase S9B family. DPPIV subfamily.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               -i- SUBCELLULAR LOCATION: Type II membrane protein. Also exists in a soluble form (By similarity).

-i- TISSUB SPECIFICITY: Intestinal epithelium, dendritic cells and several immune system tissues.
-i- PTM: The soluble form (SDPP) derives from the membrane form (MDPP) by proteolytic procesing (By similarity).
-i- SIMILARITY: Belongs to the peptidase S9B family. DPPIV subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MEDLINE=98293306; PubMed=9629661; DOI=10.1016/S0305-0491(97)00327-1; Ben-Shooshan I., Parola A.H.; "The CP-I subunit of adenosine deaminase complexing protein from calf kidney is identical to human, mouse, and rat dipeptidyl peptidase
